Forecasting system: Hydrodynamic model

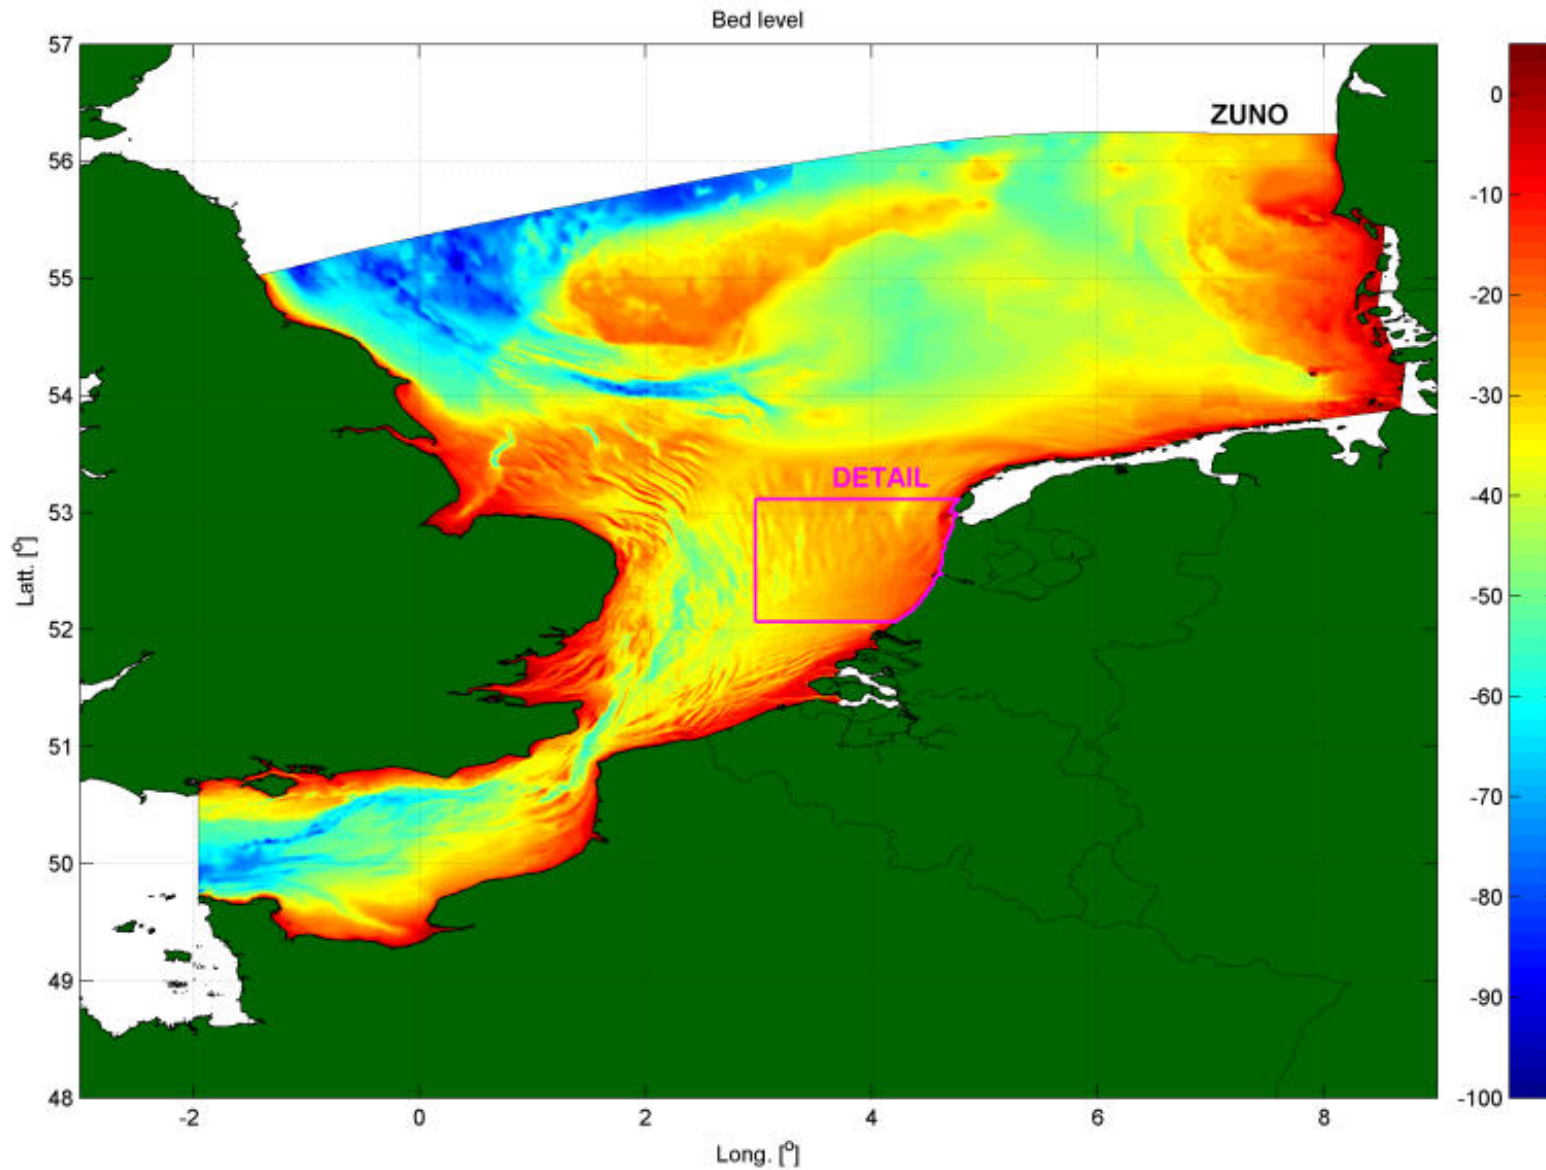

DCSM

- Grid size: 1.5' by 1.0' (~2 km)
- Grid dimensions: 1120 x 1260 cells
- Bathymetry based on NOOS gridded data set
- Tidal constituents from global tidal model (GOT00.2) on open boundaries
 - > 8 main constituents
 - > 16 smaller diurnal and semi-diurnal constituents
 - > Annual constituent Sa
- Tide Generating Forces (TGF) included (amplitude of effect TGF about 10 cm)

red line: DCSM v5 model boundary

Meteo Dashboard - Proposed system

The objective: is to develop a decision support system for operation and maintenance activities of offshore wind farms, in order to minimize costs of MWh from offshore wind.

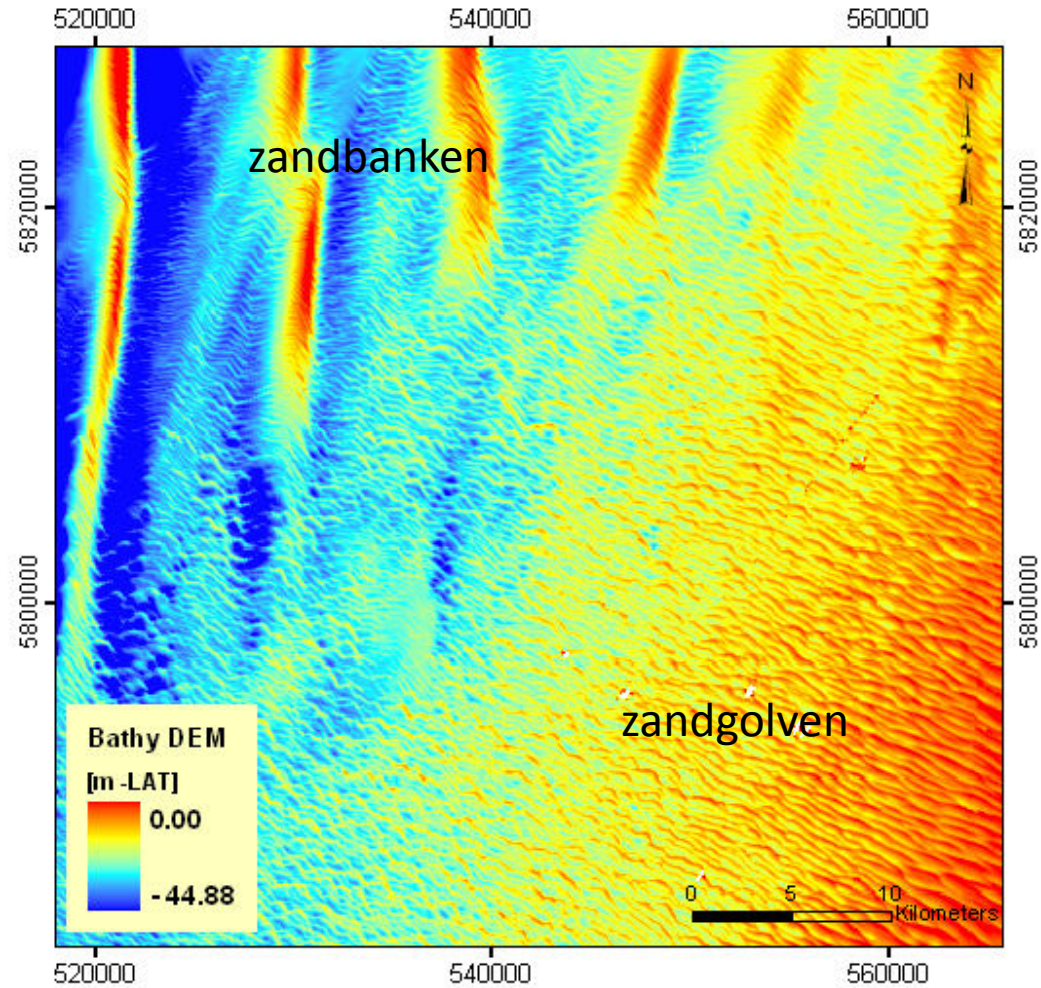

- 1. Meteo Dashboard:** an integrated software system that collects, stores and presents all relevant measured and forecasted meteo- and hydrodynamic data, in support of the decision making process of installation and maintenance activities at the OWP
- 2. Forecasting System:** a high-resolution hydrodynamic modelling system that provides forecasts of waves, currents and water levels at each wind turbine location in the offshore wind farm, on the basis of meteo- and offshore boundary conditions from various sources

Pilot project: **Tromp Binnen**, concession of RWE

Forecasting system: Marine bedforms North Sea

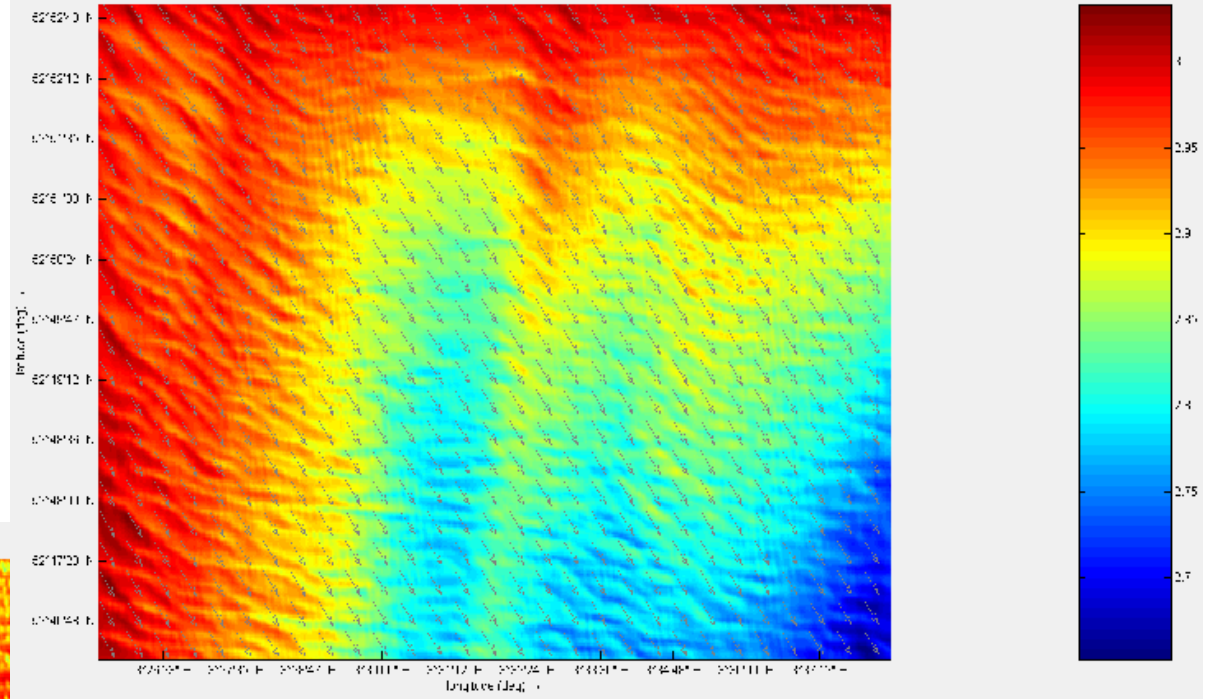

Bed Topography NCP

Waves @ Sea: effect of bed variations on waves

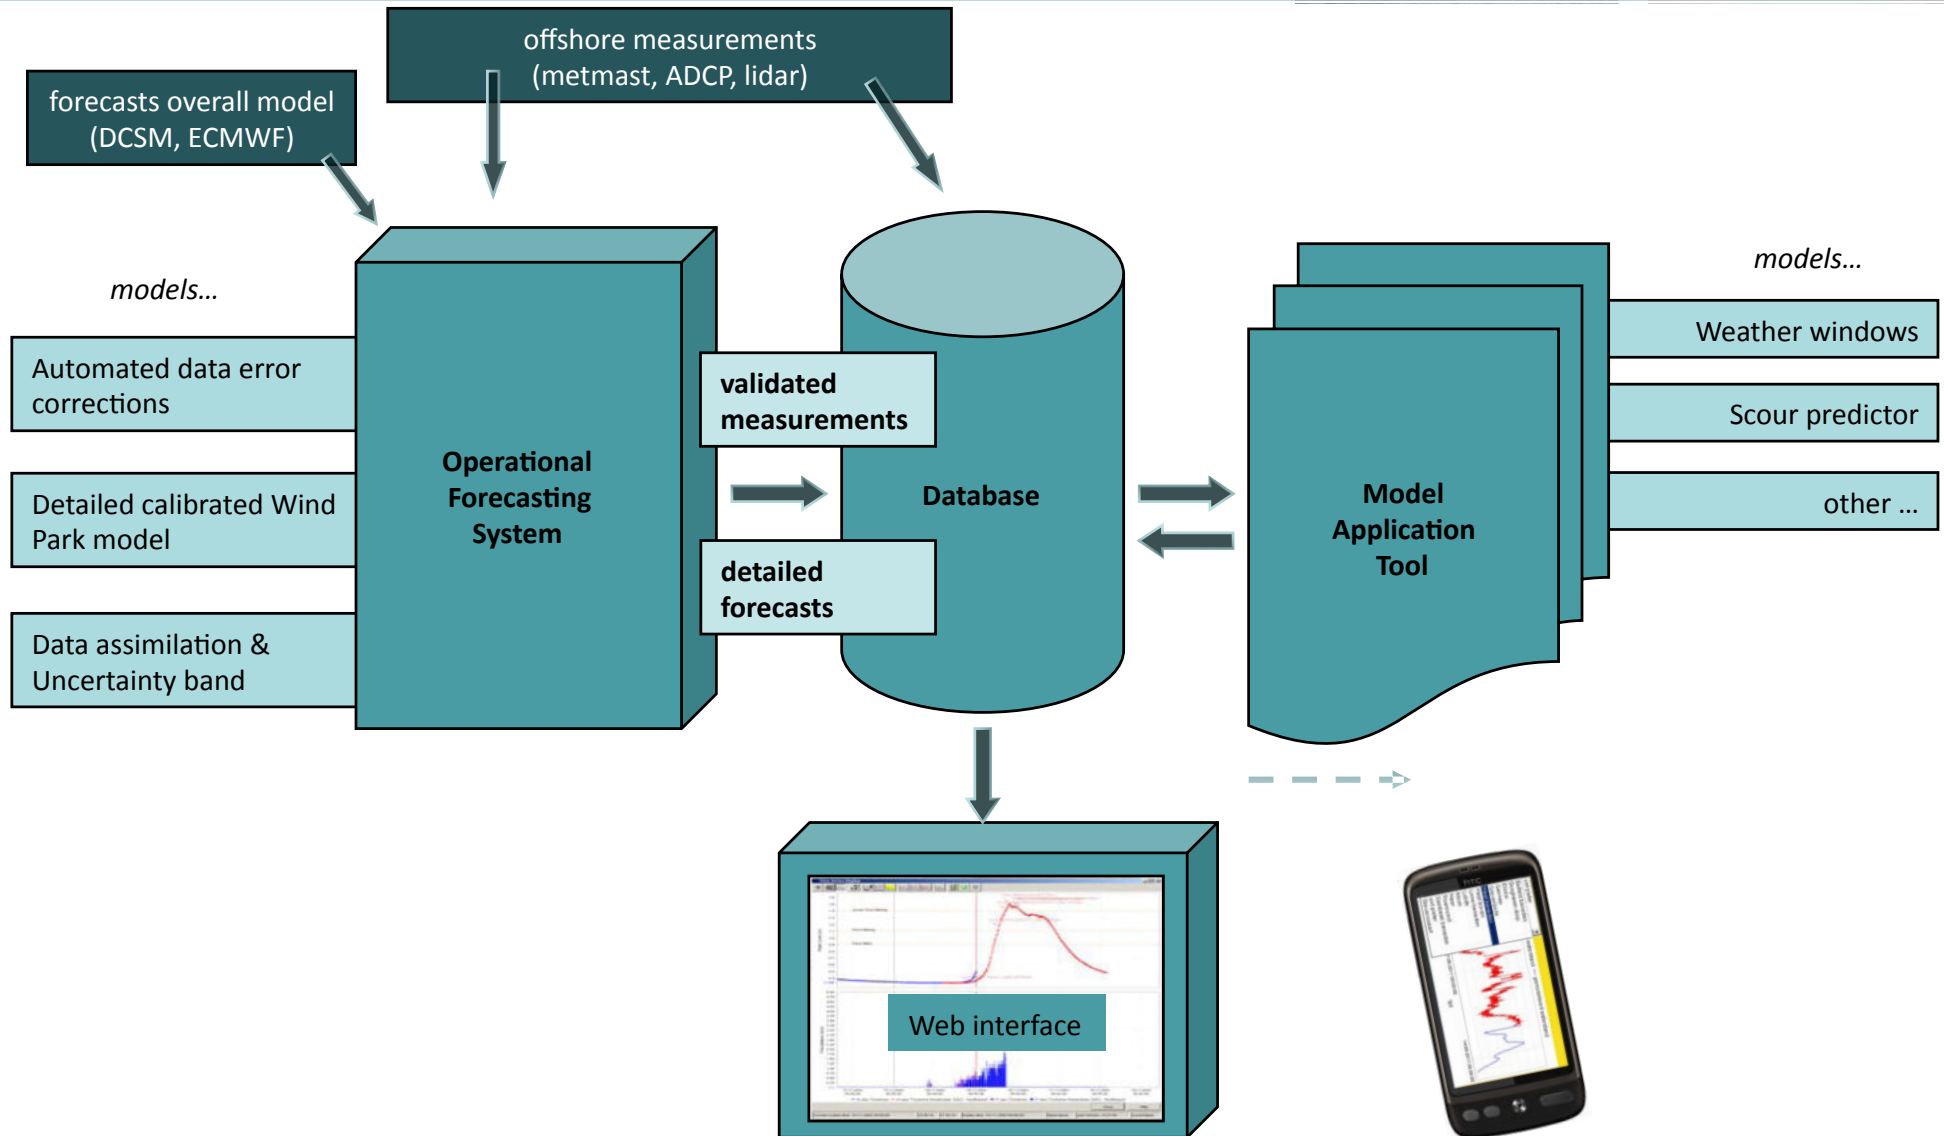

Top wave field, 0.00
14.0.2014 13:11:11

Water Depth, 0.00
14.0.2014 13:11:11

Meteo Dashboard – initial project

Meteo Dashboard: research questions

- which hydrodynamic parameters are required?
- what information should be presented in the Dashboard?
- what output will be required to smartphones (as app)?
- Is storage of forecast preferred?
- what is the preferred sampling/storage interval?
- is output at each wind turbine required?

- what data sources can be used for forecasting?
- is detailed modelling adding value to forecasts in wind farm?
- in what way can accuracy estimates of the forecasts be used in the decision making process?
- will the stored data provide a reliable source of data for fatigue analysis of individual wind turbines?

Forecasting system

- 48-hours forecast of wave parameters (H_s , T_p , T_m , Dir) per turbine
- 48-hours forecast of water level and current per turbine
- 48-hours forecast of wind parameters
- Storing measurement data in database
- Storing 0-hours forecasting (per turbine) in database
- Determination of weather windows (based on criteria)
- Presentation of measurements and forecasting at Dashboard (app)
- Presentation of weather windows at Dashboard (app)
- Client-server software system with FEWS application

Forecasting system: Validation

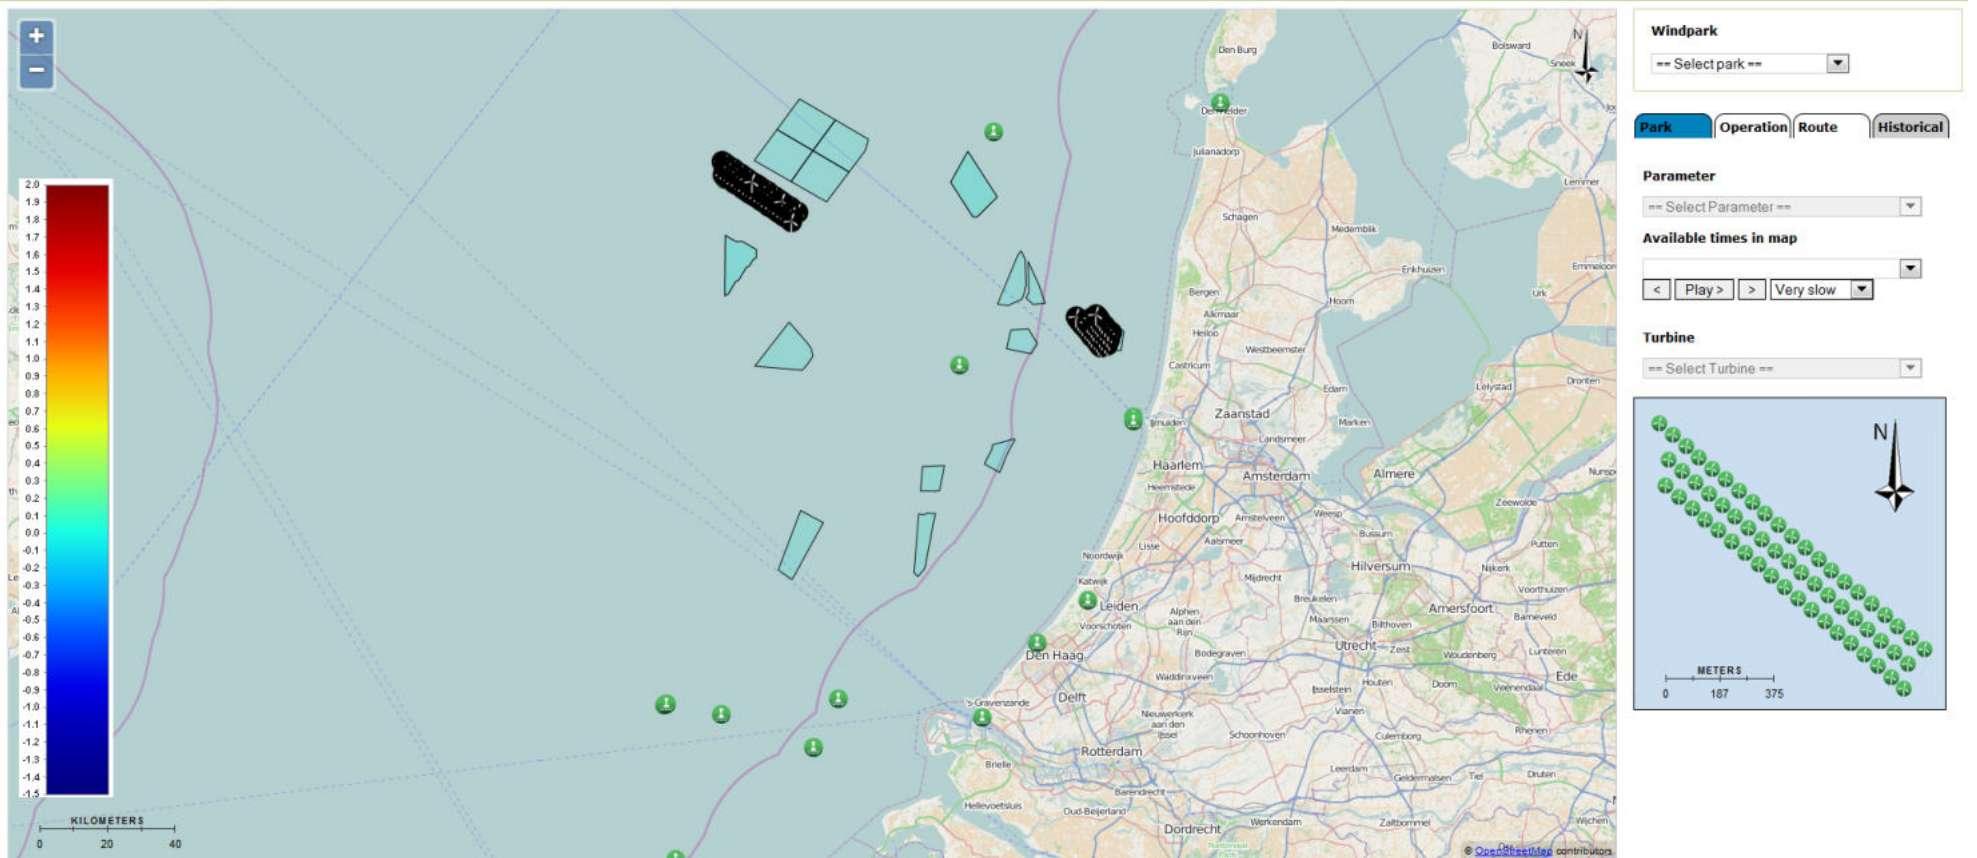

- Validation of parameters during non-storm period of the year (measurement stations, see a.o. next slide):
 - Water level
 - Currents
 - **Wave height**
 - **Wave period**
- Forecast period: spring & summer 2013 / 2014
- Compare with measurements, a.o. Tromp Binnen Met Mast

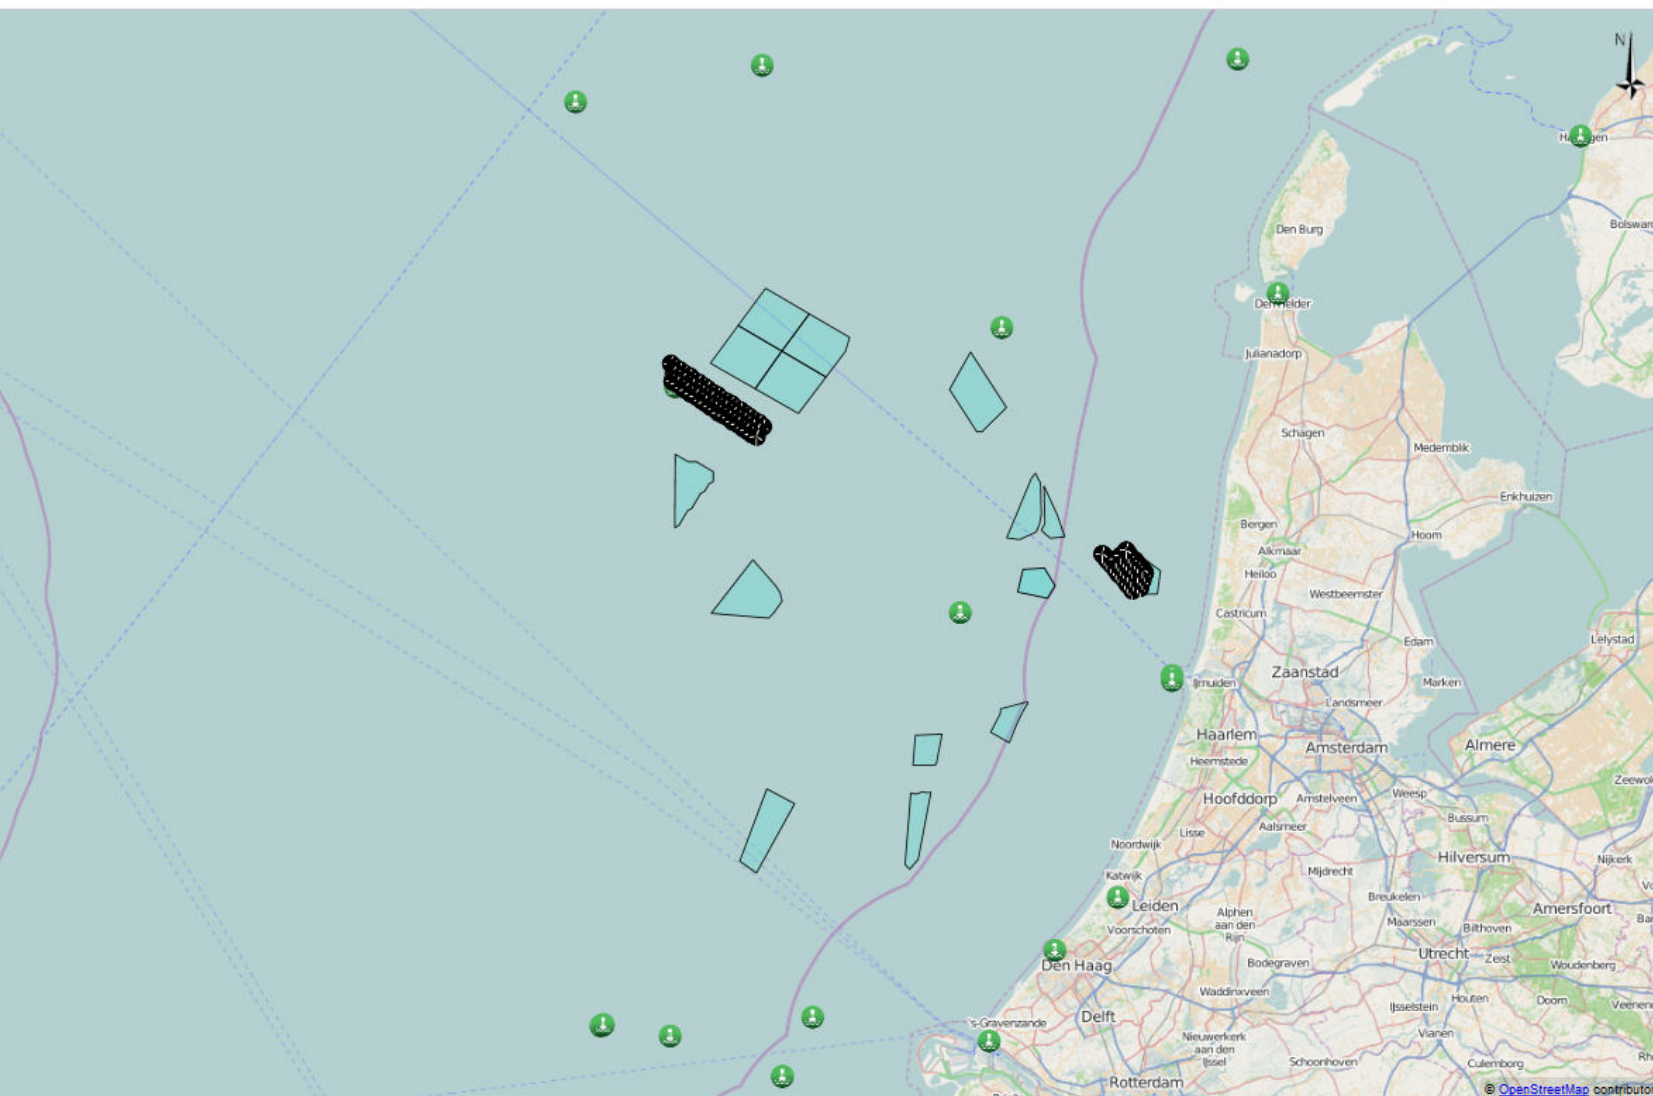

Forecasting system: Validation

- Validation of parameters during non-storm period of the year:
 - Water level
 - Currents
 - **Wave height**
 - **Wave period**
- Forecast period: spring & summer 2013
- Compare with measurements, a.o. Tromp Binnen Met Mast

The main part of the dashboard is a map showing a water level forecast. A color scale on the left ranges from -1.5 (dark blue) to 2.0 (dark red). The map shows a grid of colored cells representing water level predictions. A red dashed line indicates the location of the Tromp binnen windpark. A pop-up window titled "Water level - Turbine45" shows a line graph of water level (m) over time from 19-Dec 00:00 to 21-Dec 18:00. The graph shows a fluctuating blue line with a peak of approximately 1.0 m and a trough of approximately -0.75 m. The source is cited as "DFLOWFM_trompbinnen".

An inset map on the right shows a grid of red circular markers representing turbines. One marker is highlighted with a white box and labeled "Turbine 45". A scale bar below the inset map shows 0, 187, and 375 meters.

--

wish list – to do list - future developments

- Further optimise forecasts using data-assimilation
- Analyse accuracy of forecasts applying different boundary conditions (GFS)
- Coupling with scour tool
- Coupling with SCADA system
- Coupling with Tromp Binnen metmast and Eneco's lidar bouy
- Integrate other environmental parameters, e.g. visibility, air temperature, etc.
- Make applicable for installation phase of offshore wind farms
- Integrate different vessel types (RAO's)
- And ???
